Problem Statement: Abalone Age Prediction

Description:

Predicting the age of abalone from physical measurements. The age of abalone is determined by cutting the shell through the cone, staining it, and counting the number of rings through a microscope -- a boring and time-consuming task. Other measurements, which are easier to obtain, are used to predict age. Further information, such as weather patterns and location (hence food availability) may be required to solve the problem.

Importing Modules

```
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
import numpy as np
```

1. Dataset has been downloaded

```
In [ ]: #Name of the dataset: abalone.csv
```

2. Load the dataset into the tool

```
In [ ]: data=pd.read_csv("abalone.csv")
    data.head()
```

Out[]:		Sex	Length	Diameter	Height	Whole weight	Shucked weight	Viscera weight	Shell weight	Rings
	0	М	0.455	0.365	0.095	0.5140	0.2245	0.1010	0.150	15
	1	М	0.350	0.265	0.090	0.2255	0.0995	0.0485	0.070	7
	2	F	0.530	0.420	0.135	0.6770	0.2565	0.1415	0.210	9
	3	М	0.440	0.365	0.125	0.5160	0.2155	0.1140	0.155	10
	4	1	0.330	0.255	0.080	0.2050	0.0895	0.0395	0.055	7

Let's know the shape of the data

```
In []: data.shape

Out[]: (4177, 9)
```

One additional task is that, we have to add the "Age" column using "Rings" data. We just have to add '1.5' to the ring data

```
In [ ]:
    Age=1.5+data.Rings
    data["Age"]=Age
    data=data.rename(columns = {'Whole weight':'Whole_weight', 'Shucked weight': 'Shell_weight': 'Shell_weight'})
    data=data.drop(columns=["Rings"],axis=1)
    data.head()
```

Out[]:		Sex	Length	Diameter	Height	Whole_weight	Shucked_weight	Viscera_weight	Shell_weig
	0	М	0.455	0.365	0.095	0.5140	0.2245	0.1010	0.1
	1	М	0.350	0.265	0.090	0.2255	0.0995	0.0485	0.0
	2	F	0.530	0.420	0.135	0.6770	0.2565	0.1415	0.2
	3	М	0.440	0.365	0.125	0.5160	0.2155	0.1140	0.1
	4	1	0.330	0.255	0.080	0.2050	0.0895	0.0395	0.0
	4								>

3. Perform Below Visualizations.

(i) Univariate Analysis

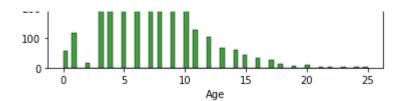

The term univariate analysis refers to the analysis of one variable. You can remember this because the prefix "uni" means "one." There are three common ways to perform univariate analysis on one variable: 1. Summary statistics – Measures the center and spread of values.

Histogram

```
In [ ]: sns.displot(data["Age"], color='darkorange')
Out[ ]: <seaborn.axisgrid.FacetGrid at 0x7fd3f837a430>
```

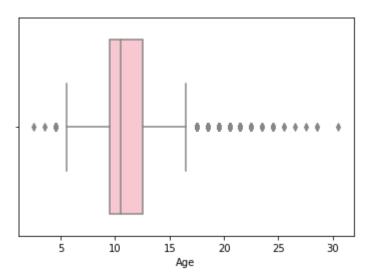

200 -

Boxplot

```
In [ ]: sns.boxplot(x=data.Age,color='pink')
```

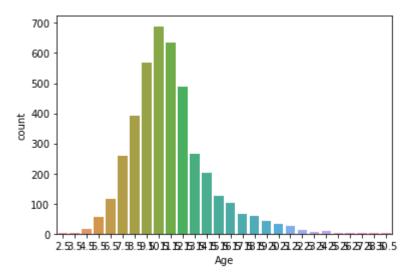

Out[]: <AxesSubplot:xlabel='Age'>

Countplot

```
In [ ]: sns.countplot(x=data.Age)
```

Out[]: <AxesSubplot:xlabel='Age', ylabel='count'>

(ii) Bi-Variate Analysis

Image result for bivariate analysis in python It is a methodical statistical technique applied to a pair of variables (features/ attributes) of data to determine the empirical relationship between them. In order words, it is meant to determine any concurrent relations (usually over and above a simple correlation analysis).

Barplot

```
In []: sns.barplot(x=data.Height,y=data.Age)
Out[]: 

CAxesSubplot:xlabel='Height', ylabel='Age'>

17.5
15.0
12.5
5.0
2.5
0.0
Height

Height

Height

Height

To start the start the
```

Linearplot

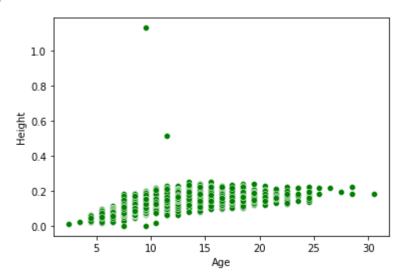

0.00

```
5 10 15 20 25 30
```

Scatterplot

```
In [ ]: sns.scatterplot(x=data.Age,y=data.Height,color='green')
```

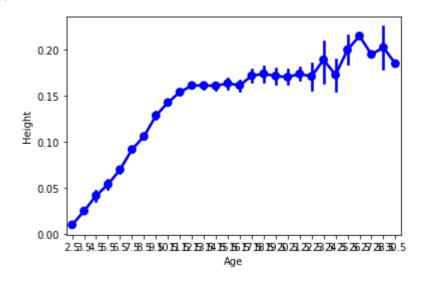

Out[]: <AxesSubplot:xlabel='Age', ylabel='Height'>

Pointplot

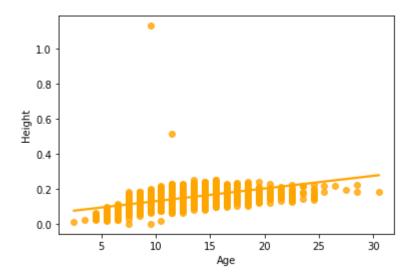

```
In [ ]: sns.pointplot(x=data.Age, y=data.Height, color="blue")
```

Out[]. <AxesSubplot:xlabel='Age', ylabel='Height'>

Regplot

```
In [ ]: sns.regplot(x=data.Age,y=data.Height,color='orange')
Out[ ]: <AxesSubplot:xlabel='Age', ylabel='Height'>
```

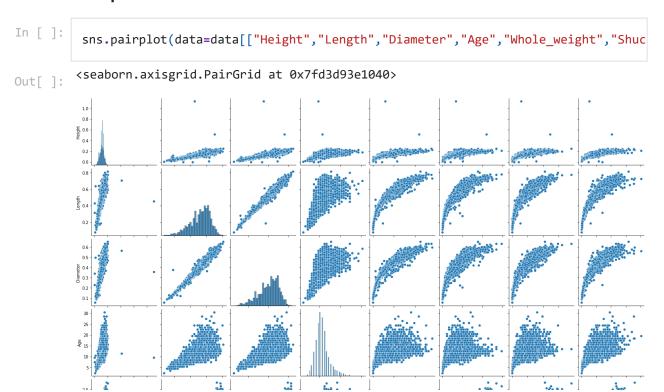

(iii) Multi-Variate Analysis

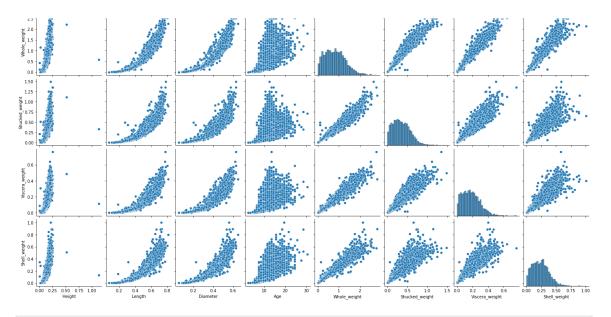

Multivariate analysis is based in observation and analysis of more than one statistical outcome variable at a time. In design and analysis, the technique is used to perform trade studies across multiple dimensions while taking into account the effects of all variables on the responses of interest.

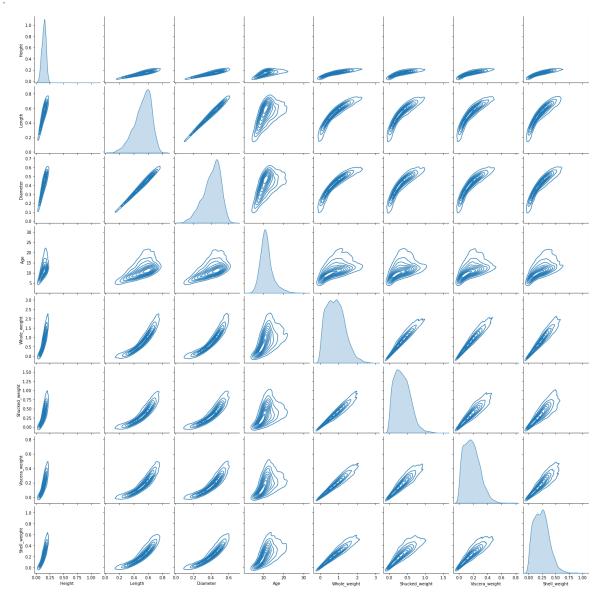

Pairplot

In []: sns.pairplot(data=data[["Height","Length","Diameter","Age","Whole_weight","Shuc

Out[]: <seaborn.axisgrid.PairGrid at 0x7fd39840c790>

4. Perform descriptive statistics on the dataset

[]: da	data.describe(include='all')											
[]:		Sex	Length	Diameter	Height	Whole_weight	Shucked_weight	Viscera_				
C	count 4177 4177.000000		4177.000000	4177.000000	4177.000000	4177.000000	4177.000000	4177.				
un	nique	3	NaN	NaN	NaN	NaN	NaN					
	top	М	NaN	NaN	NaN	NaN	NaN					
	freq	1528	NaN	NaN	NaN	NaN	NaN					
n	nean	NaN	0.523992	0.407881	0.139516	0.828742	0.359367	0.				
	std NaN 0.120093		0.099240	0.041827	0.490389	0.221963	0.					
	min NaN 0.075000		0.075000	0.055000	0.000000	0.002000	0.001000	0.				
	25%	NaN	0.450000	0.350000	0.115000	0.441500	0.186000	0.				
	50%	NaN	0.545000	0.425000	0.140000	0.799500	0.336000	0.				
	75% NaN 0.615000		0.480000	0.165000	1.153000	0.502000	0.					
	max NaN 0.815000		0.650000	1.130000	2.825500	1.488000	0.					
4								>				

5. Check for Missing values and deal with them

```
In [ ]:
         data.isnull().sum()
                           0
        Sex
Out[]:
        Length
                           0
        Diameter
        Height
        Whole_weight
                           0
        Shucked_weight
        Viscera_weight
                           0
        Shell_weight
                           0
        Age
        dtype: int64
```

6. Find the outliers and replace them outliers

	<pre>outliers=data.quantile(q=(0.25,0.75)) outliers</pre>
--	---

Out[]:		Length	Diameter	Height	Whole_weight	Shucked_weight	Viscera_weight	Shell_weight
	0.25	0.450	0.35	0.115	0.4415	0.186	0.0935	0.130
	0.75	0.615	0.48	0.165	1.1530	0.502	0.2530	0.329

```
In [ ]:
         a = data.Age.quantile(0.25)
         b = data.Age.quantile(0.75)
         c = b - a
         lower_limit = a - 1.5 * c
         data.median(numeric_only=True)
        Length
                            0.5450
Out[]:
        Diameter
                            0.4250
        Height
                            0.1400
        Whole_weight
                            0.7995
        Shucked_weight
                            0.3360
        Viscera_weight
                            0.1710
        Shell_weight
                            0.2340
                           10.5000
        Age
        dtype: float64
In [ ]:
         data['Age'] = np.where(data['Age'] < lower_limit, 7, data['Age'])</pre>
         sns.boxplot(x=data.Age,showfliers = False)
        <AxesSubplot:xlabel='Age'>
Out[]:
                             10
                                     12
                                             14
                                                     16
                                Age
```

7. Check for Categorical columns and perform encoding

In []:	data.head()											
Out[]:		Sex	Length	Diameter	Height	Whole_weight	Shucked_weight	Viscera_weight	Shell_weig			
	0	М	0.455	0.365	0.095	0.5140	0.2245	0.1010	0.1			
	1	М	0.350	0.265	0.090	0.2255	0.0995	0.0485	0.0			
	2	F	0.530	0.420	0.135	0.6770	0.2565	0.1415	0.2			
	3	М	0.440	0.365	0.125	0.5160	0.2155	0.1140	0.1			
	4	I	0.330	0.255	0.080	0.2050	0.0895	0.0395	0.0			

```
In [ ]:
           from sklearn.preprocessing import LabelEncoder
           lab = LabelEncoder()
           data.Sex = lab.fit_transform(data.Sex)
          data.head()
Out[]:
                                     Height Whole_weight Shucked_weight Viscera_weight Shell_weig
             Sex Length

                                                                                      0.1415
          3
               2
                    0.440
                              0.365
                                                     0.5160
                                                                                                     0.1
                                       0.125
                                                                      0.2155
                                                                                      0.1140
                    0.330
                              0.255
                                       0.080
                                                     0.2050
                                                                      0.0895
                                                                                      0.0395
                                                                                                     0.0
```

8. Split the data into dependent and independent variables

```
In [ ]:
           y = data["Sex"]
           y.head()
                2
Out[ ]:
                2
          3
                2
          Name: Sex, dtype: int64
In [ ]:
           x=data.drop(columns=["Sex"],axis=1)
           x.head()
Out[]:
             Length
                      Diameter Height Whole_weight Shucked_weight Viscera_weight Shell_weight A
               0.455
                          0.365
                                  0.095
                                                0.5140
                                                                  0.2245
                                                                                  0.1010
                                                                                                0.150
               0.350
                          0.265
                                  0.090
                                                0.2255
                                                                  0.0995
                                                                                  0.0485
                                                                                                0.070
               0.530
                          0.420
                                  0.135
                                                0.6770
                                                                  0.2565
                                                                                  0.1415
                                                                                                0.210
               0.440
                          0.365
                                  0.125
